CDC 500 Cities: Healthcare Access, Behaviors, and Health Outcomes

Stat 198 Final Project

Maya Ghanem and Isabelle Xiong

11/1/2021

Description of Data

(Include description of how you edited the data)

Research Questions

- 1) Do cities with a greater lack of healthcare access have poorer mental health and/or physical health outcomes?
- 2)Does healthcare access, mental health, and/or physical health outcomes vary by state?

Variables of Interest

Explanatory Variables:

- 1) Healthcare Access for Adults (18+): Percent of City Population that Lacks Insurance, Percent of City Population with visits to doctor for routine checkup within the past year, Percent of City Population who have high blood pressure and are taking medicine for high blood pressure control.
- 2) Geographic Distribution by State

Response Variables:

- 1) Behavior for Adults (18+): Percent of city population currently smoking, percent of city population currently reporting binge drinking habits, percent of city population reporting No leisure-time physical activity
- 2) Health Outcomes for Adults (18+): Percent of city population with coronary heart disease, percent of population diagnosed with diabetes, percent of city population with kidney disease

Linear Regressions

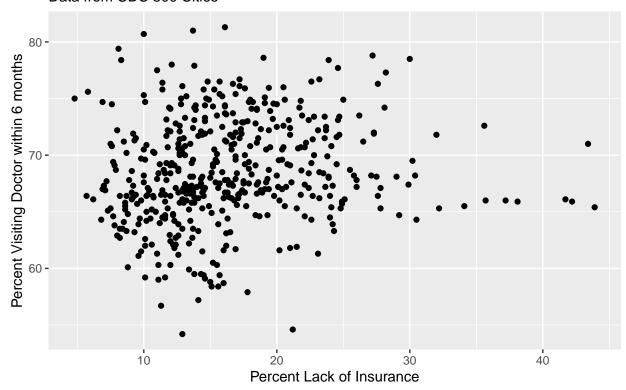

New Method:

- a) Run correlations between the explanatory variables
- b) Run linear regressions and adjusted r squared values
- c) Assess which regression is better
- d) Run the residual plot and the graph

Correlations between Explanatory Variables

```
data_500_cities %>%
  ggplot(mapping = aes(x = insurance, y = visits_to_doctor)) +
  geom_point() +
  labs(
    title = "Relationship Between Lack of Insurance and Visits to Doctor",
    subtitle = "Data from CDC 500 Cities",
    x = "Percent Lack of Insurance",
    y = "Percent Visiting Doctor within 6 months"
)
```

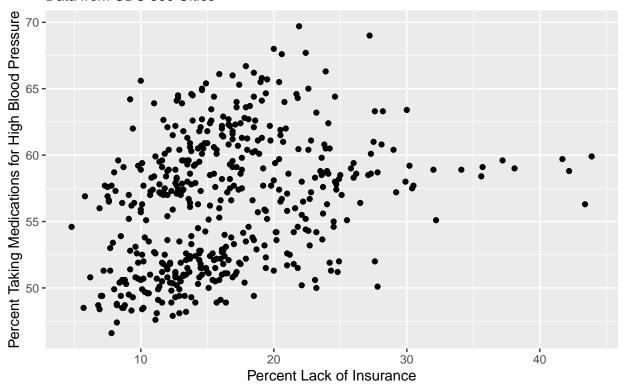

Relationship Between Lack of Insurance and Visits to Doctor Data from CDC 500 Cities

There does not seem to be any significant correlation.

```
data_500_cities %>%
  ggplot(mapping = aes(x = insurance, y = medicine_high_bp)) +
  geom_point() +
  labs(
    title = "Relationship Between Lack of Insurance and Percent Pop Taking BP Meds",
    subtitle = "Data from CDC 500 Cities",
    x = "Percent Lack of Insurance",
    y = "Percent Taking Medications for High Blood Pressure"
)
```

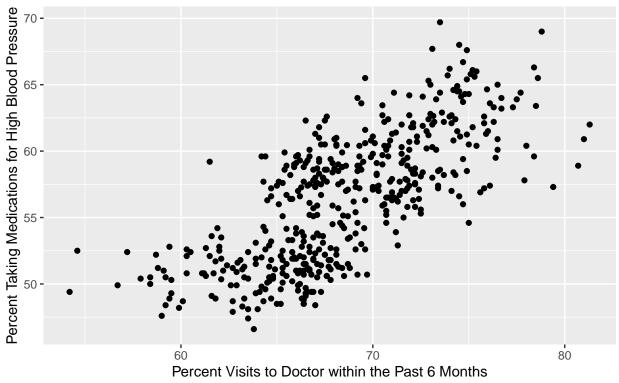

Relationship Between Lack of Insurance and Percent Pop Taking BP Meds Data from CDC 500 Cities

There does not seem to be any significant correlation.

```
data_500_cities %>%
  ggplot(mapping = aes(x = visits_to_doctor, y = medicine_high_bp)) +
  geom_point() +
  labs(
    title = "Relationship Between Visits to Doctor and Percent Pop Taking BP Meds",
    subtitle = "Data from CDC 500 Cities",
    x = "Percent Visits to Doctor within the Past 6 Months",
    y = "Percent Taking Medications for High Blood Pressure"
)
```

There seems to be a significant correlation between Visits to Doctor and Taking Medications.

As a result, I will test three models: one with no interaction variables, one with only one interaction variable ($Visits_to_Doctor * medicine_high_bp$), and one with all three interaction variables.

Running Linear Regressions

Linear Regression with No Interaction Variables:

Fit without Interaction Variables

```
access_smoking_fit <- linear_reg() %>%
  set_engine("lm") %>%
  fit(smoking ~ insurance + visits_to_doctor + medicine_high_bp, data = data_500_cities)
access_smoking_fit_aug <- augment(access_smoking_fit$fit)
tidy(access_smoking_fit) %>%
  print()
```

1) Access Variables vs. Smoking

```

It seems like pretty much all the overall tests indicate significant variance across the groups.
Step Down Tests
insurance_state_pair <- pairwise.t.test(data_500_cities$insurance,</pre>
                                                                        data_500_cities$StateDesc, p.adj
sig_ins_state_pairs <- broom::tidy(insurance_state_pair) %>%
 filter(p.value<0.05) %>%
  arrange(group1,group2)
nrow(sig_ins_state_pairs)
## [1] 0
print(sig_ins_state_pairs)
## # A tibble: 0 x 3
## # ... with 3 variables: group1 <chr>, group2 <chr>, p.value <dbl>
The overall ANOVA test says there is a significance but the Step Down stests show no significant pairs?
doctor_state_pair <- pairwise.t.test(data_500_cities$visits_to_doctor,</pre>
                                                                            data_500_cities$StateDesc, p.
sig_doctor_state_pairs <- broom::tidy(doctor_state_pair) %>%
  filter(p.value<0.05)
nrow(sig_doctor_state_pairs)
## [1] 0
print(sig_doctor_state_pairs)
## # A tibble: 0 x 3
## # ... with 3 variables: group1 <chr>, group2 <chr>, p.value <dbl>
Ok so there is clearly an issue. I think I am interpreting the F-statistic incorrectly?
smoking_state_pair <- pairwise.t.test(data_500_cities$smoking,</pre>
                                                                    data_500_cities$StateDesc)
sig_smoking_state_pairs <- broom::tidy(smoking_state_pair) %>%
